

Presentations in Scribus / Acrobat

Tutorial for creating presentations with Scribus / Acrobat

- Create a Scribus-document with orientation landscape
- Create a box with a solid or a gradient fill like the backgrounds in this example (certainly, you can also use a picture-box or whatever you like)
- Expand this box to the size of the paper
- Set the X- and Y-coordinations of the box both to 0
- Add a new layer - this one is for the text and other elements, so you will not touch the background when editing your content
- Fill your pages with content
- Use "File / Export" to export your presentation to the Acrobat PDF-format. Here in the options under "Extras" you can add some special effects for every page:
- Open the PDF-file in Acrobat and click "View / Full Screen". The Presentation starts :-)
